The Environmental Concerns and Human Rights Issues

f we look at society from a historical perspective, we realize that protection and preservation of the environment has been integral to the cultural and religious ethos of most human communities. Nature has been venerated by ancient Hindus, Greeks, Native Americans and other religions around the world. They worshipped all forms of nature believing that it emanated the spirit of God. Hinduism declared in its dictum that "(t)he Earth is our mother and we are all her children."[1] The ancient Greeks worshipped Gaea or the Earth Goddess. Islamic law regards man as having inherited "all the resources of life and nature" and having certain religious duties to God in using them.^[2] In the Judeo-Christian tradition, God gave the earth to his people and their offspring as an everlasting possession, to be cared for and passed on to each generation.[3]

Reciprocity between these two spheres

Over the years, the international community has increased its awareness on the relationship between environmental degradation and human rights abuses. It is clear that, poverty situations and human rights abuses are worsened by environmental degradation. This is for several obvious reasons; Firstly, the exhaustion of natural resources leads to unemployment and emigration to cities. Secondly, this affects the enjoyment and exercise of basic human rights. Environmental conditions contribute to a large extent, to the spread of infectious diseases. From the 4,400 million of people who live in developing countries, almost 60% lack basic health care services, almost a third of these people have no access to safe water supply. Thirdly, degradation poses new problems such as environmental

refugees. Environmental refugees suffer from significant economic, socio-cultural, and political consequences. And fourthly, environmental degradation worsens existing problems suffered by developing and developed countries. Air pollution, for example, accounts for 2.7 million to 3.0 million of deaths annually and of these, 90% are from developing countries. Environmental and human rights law have essential points in common that enable the creation of a field of cooperation between the two: Firstly, both disciplines have deep social roots; even though human rights law is more rooted within the collective consciousness, the accelerated process of environmental degradation is generating a new "environmental consciousness. Secondly, both disciplines have become internationalized. The international community has assumed commitment to observe the realization of human rights and respect for the environment. From the Second World War^[4] onwards, the relationship State-individual is of pertinence to the international community. On the other hand, the phenomena brought on by environmental degradation trascends political boundaries and is of critical importance to the preservation of world peace and security. The protection of the environment is internationalized, while the State-Planet Earth relationship has become a concern of the international community. Thirdly, both areas of law tend to universalize their object of protection. Human Rights are presented as universal and the protection of the environment appears as everyone's responsibility.

Approaches to environmental law and human rights

Human rights and environmental law have traditionally been envisaged as two distinct, independent spheres of rights. Towards the last quarter of the 20th century, however, the perception arose that the cause of protection of the environment could be promoted by setting it in the framework of human rights, which had by then been firmly established as a matter of international law and practice. Because of the many complex issues that arise when these two seemingly distinct spheres interact, it is to be expected that there are different views on how to approach 'human rights and the environment'.

The first approach is one where environmental protection is described as a possible means of fulfilling human rights standards. environmental law is conceptualized as 'giving a protection that would help ensure the well-being of future generations as well as the survival of those who depend immediately upon natural resources for their livelihood.' Here, the end is fulfilling human rights, and the route is through environmental law. The second approach places the two spheres in inverted positions – it states that 'the legal protection of human rights is an effective means to achieving the ends of conservation and environmental protection.' The second approach therefore highlights the presently existing human rights as a route to environmental protection. The focus is on the existing human right. In this context, there exists a raging debate on whether one should recognize an actual and independent right to a satisfactory environment as a legally enforceable right. This would obviously shift the emphasis onto the environment and away from the human rights. These are the subtle distinctions between the two ways in which this approach can be taken.

A *third* approach to the question of 'human rights and the environment' is to deny the existence of any formal connection between the two at all. According to this approach, there is no requirement for an

'environmental human right.' The argument goes that, since the Stockholm Conference in 1972, international environmental law has developed to such extents that even the domestic environments of states has been internationalized. In light of the breadth of environmental law and policy, and the manner in which it intrudes into every aspect of environmental protection in an international sense and notwithstanding the concept of state sovereignty, it is argued that it is unnecessary to have a separate human right to a decent environment. This view militates against the confusion of the two distinct spheres of human rights law and environmental law. However, there are many who oppose this view. They argue that there is in fact a benefit to bringing environmental law under the ambit of human rights. Environmental law has in many parts of the world, be it at the international or domestic level, suffered from the problem of standing. Because of this barrier, it is often difficult for individuals or groups to challenge infringements of environmental law, treaties or directives, as the case may be.

There has been a great deal of debate on the theoretical soundness of the idea of a human right or rights to a satisfactory environment.[5] For one thing, there can occasionally be a conflict, or tension, between the established human rights and the protection of the environment per se. There are circumstances where the full enjoyment of the rights to life, to healthy living and to ones culture can lead to the depletion of natural resources and environmental degradation. Nevertheless, clearly there is a prima facie rhetorical and moral advantage in making the environment a human rights issue.[6] There has been a simultaneous increase in 'legal claims for both human rights and environmental goods,' which is a clear reflection of the link between 'human' and the 'environment' and the dependence of human life on the environment.

International Bodies on the issue

The right to a healthy environment is now to be found in a number of regional human rights instruments

around the world. Article 11 of the Additional Protocol to the Inter-American Convention on Human Rights (1994) popularly known as the San Salvador Protocol, states that (1) everyone shall have the right to live in a healthy environment and to have access to basic public services; (2) the state parties shall the protection, preservation promote improvement of the environment. The Convention on the Rights of the Child (1989) at article 24(2) (c) requires State parties in the mater of combating disease and malnutrition to take into consideration. 'the damage and risks of environmental pollution.' The African Charter on Human and People's Rights 1981 proclaims in Art. 24(1) a right to 'a general satisfactory environment favourable to their development.' In fact, the Final Report of the Special Rapporteur on Prevention of Discrimination and Protection of Minorities^[7] listed over 15 rights relative to environmental quality. Some of these include:

- a. the right to freedom from pollution, environmental degradation and activities which threaten life, health or livelihood;
- b. protection and preservation of the air, soil, water, flora and fauna;
- c. healthy food and water; a safe and healthy working environment.

The first principle of the 1972 Stockholm Declaration declares that: "Man has the fundamental right to freedom, equality and adequate conditions of life, in an environment of a quality that permits a life of dignity and well being, and he bears a solemn responsibility to protect and improve the environment for present and future generations." Almost twenty years later, in resolution 45/94 the UN General Assembly recalled the language of Stockholm, stating that all individuals are entitled to live in an environment adequate for their health and well-being. The resolution called for enhanced efforts towards ensuring a better and healthier environment.

In the mid 1990s, recognizing the urgent need and importance of deepening the link between human rights and the environment, and of exploring ways to achieve a better collaboration, harmony, and

complement the agendas of different United Nations institutions working on both subjects, the UN created the position of Special Rapporteur on Human Rights and Environment. The Rapporteur prepared an important report, the Ksentini Report, which offered a theoretical, thematic, and practical framework to address the linkages between human rights and the environment.

In the absence of petition procedures pursuant to environmental treaties, cases concerning the impact of environmental harm on individuals and groups have often been brought to international human rights bodies. For example, the Committee on the Elimination of Discrimination Against Women linked environment to the right to health in its Concluding Observations on the State report of Romania, expressing its "concern about the situation of the environment, including industrial accidents, and their impact on women's health." [9]

The same can be seen in reports submitted by the Committee on the Rights of the Child. In its Concluding Observations on the State report submitted by Jordan, the CRC recommended that Jordan "take all appropriate measures, including through international cooperation, to prevent and combat the damaging effects of environmental pollution and contamination of water supplies on children and to strengthen procedures for inspection."[10] The CRC's Concluding Observations on South Africa also expressed the Committee's "concern at the increase in environmental degradation, especially as regards air pollution" and "recommend[ed] that the State party increase its efforts to facilitate the implementation of sustainable development programmes to prevent environmental degradation, especially as regards air pollution."[11] Links between the environment and human rights have also been recognized by the Inter-American Court of Human Rights. The case of Awas Tingni Mayagna (Sumo) Indigenous Community v. Nicaragua, involved the protection of Nicaraguan forests in lands traditionally owned by the Awas Tingni. Government-sponsored logging on this native land was found to be a violation of the human rights of these tribals. Similarly, the Commission established a link between environmental quality and the right to life in response to a petition brought on behalf of the Yanomani Indians of Brazil.^[12] The construction of a highway was found to have violated the American Declaration of the Rights and Duties of Man.

The European Convention on Human Rights has also been invoked in environmental matters. In Europe, most of the victims invoke either the right to information or the right to privacy guaranteed under the Convention. Under the said Convention and Protocol, it has been recognized that pollution or other environmental harm can result in a breach of ones right to privacy and family life. While this harm may be excused if it results from an authorized activity of economic benefit to the community in general, as long as there is no disproportionate burden on any particular individual; i.e. the measures must have a legitimate aim, be lawfully enacted, and be proportional. Of course, the State enjoys some margin in determining the legitimacy of the aim being pursued, but the Court has been playing an active role in ensuring fairness and balancing the scales. One important point to be noted in the context of the European Convention is the fact that it has successfully invoked most of all in the context of environmental pollution. Resource management, nature conservation and the protection of biological diversity have not been easily brought under the rubric of the European Convention. This is because of the absence of a specific right to a safe and ecologically-balanced environment.

Nearly all global and regional human rights bodies have accepted the link between environmental degradation and internationally-guaranteed human rights. In nearly every instance, the complaints brought have not been based upon a specific right to a safe and environmentally-sound environment, but rather upon rights to life, property, health, information, family and home life. Underlying the complaints, however, are instances of pollution, deforestation, water pollution, and other types of environmental harm.

Judicial interventions -A Case of South Asia

If we look at the developments that are taking place through the intervention of national Courts in various parts of the world, we come to note several things: *first*, the courts are moving the right to a healthy environment up the hierarchy of human rights by recognising it as a fundamental right; *second*, the courts are defining the content and nature of the right to a healthy environment through landmark decisions.

The question of human rights and the environment has also come up for consideration in our neighbouring countries.

The Constitution of Bangladesh does not explicitly provide for the right to healthy environment either in the directive principles or as a fundamental right. Article 31 states that every citizen has the right to protection from 'action detrimental to the life liberty, body, reputation, or property', unless these are taken in accordance with law. It added that the citizens and the residents of Bangladesh have the inalienable right to be treated in accordance with law. If these rights are taken way, compensation must be paid. In 1994, a public interest litigation[13] was initiated before the Supreme Court dealing with air and noise pollution. The Supreme Court agreed with the argument presented by the petitioner that the constitutional 'right to life' does extend to include right to a safe and healthy environment. A few years later, the Appellate Division and the High Court Division of the Supreme Court dealt with this question in a positive manner, in the case of Dr. M. Faroogue v. Bangladesh, [14] reiterating Bangladesh's commitment in the 'context of engaging concern for the conservation of environment, irrespective of the locality where it is threatened.'

Article 9 of the Constitution of Pakistan states that no person shall be deprived of life or liberty save in accordance with the law. The Supreme Court in Shehla Zia v. WAPDA[15] decided that Article 9 includes 'all such amenities and facilities which a person born in a free country is entitled to enjoy with dignity, legally and constitutionally'. The petitioner

questioned whether, under article 9 of the Constitution, citizens were entitled to protection of law from being exposed to hazards of electromagnetic field or any other such hazards which may be due to installation and construction of any grid station, any factory, power station or such like installations. The Court noted that "under [the Pakistan] Constitution, Article 14 provides that the dignity of man and subject to law, the privacy of home shall be inviolable. The fundamental right to preserve and protect the dignity of man and right to 'life' are guaranteed under Article 9. If both are read together, question will arise whether a person can be said to have dignity of man if his right to life is below bare necessity line without proper food, clothing, shelter, education, health care, clean atmosphere and unpolluted environment."

Supreme Court of India-The Journey so Far

The Constitution (Forty Second Amendment) Act 1976 explicitly incorporated environmental protection and improvement as part of State policy through the insertion of Article 48A. Article 51A (g) imposed a similar responsibility on every citizen "to protect and improve the natural environment including forests, lakes, rivers, and wildlife and to have compassion for all living creatures."

One of the main objections to an independent right or rights to the environment lies in the difficulty of definition. It is in this regard that the Indian Supreme Court has made a significant contribution. When a claim is brought under a particular article of the Constitution, this allows an adjudicating body such as the Supreme Court to find a breach of this article, without the need for a definition of an environmental right as such. All that the Court needs to do is what it must in any event do; namely, define the Constitutional right before it. Accordingly, a Court prepared to find a risk to life, or damage to health, on the facts before it, would set a standard of environmental quality in defining the right litigated. This is well illustrated by the cases that have come before the Supreme Court, in particular in relation to the broad meaning given to the Right to Life under

Article 21 of the Constitution. The right to life has been used in a diversified manner in India. It includes, inter alia, the right to survive as a species, quality of life, the right to live with dignity and the right to livelihood. However, it is a negative right, and not a positive, self-executory right, such as is available, for example, under the Constitution of the Phillipines. Section 16, Article II of the 1987 Phillipine Constitution states: 'The State shall protect and advance the right of the people to a balanced and healthful ecology in accord with the rhythm and harmony of nature'. This right along with Right to Health (section 15) ascertains a balanced and healthful ecology.[18] In contrast, Article 21 of the Indian Constitution states: 'No person shall be deprived of his life or personal liberty except according to procedures established by law.' The Supreme Court expanded this negative right in two ways. Firstly, any law affecting personal liberty should be reasonable, fair and just. Secondly, the Court recognised several unarticulated liberties that were implied by Article 21. It is by this second method that the Supreme Court interpreted the right to life and personal liberty to include the right to the environment.

Rural Litigation and Entitlement Kendra v. State of U.P.[19] was one of the earliest cases where the Supreme Court dealt with issues relating to environment and ecological balance. The expanded concept of the right to life under the Indian Constitution was further elaborated on in Francis Coralie Mullin v. Union Territory of Delhi[20] where the Supreme Court set out a list of positive obligations on the State, as part of its duty correlative to the right to life. The importance of this case lies in the willingness on the part of the Court to be assertive in adopting an expanded understanding of human rights. It is only through such an understanding that claims involving the environment can accommodated within the broad rubric of human rights. The link between environmental quality and the right to life was further addressed by a constitution bench of the Supreme Court in the Charan Lal Sahu.[21] Similarly, in Subash Kumar,[22]

the Court observed that 'right to life guaranteed by article 21 includes the right of enjoyment of pollution-free water and air for full enjoyment of life.' Through this case, the Court recognised the right to a wholesome environment as part of the fundamental right to life. This case also indicated that the municipalities and a large number of other concerned governmental agencies could no longer rest content with unimplemented measures for the abatement and prevention of pollution. They may be compelled to take positive measures to improve the environment.

The Supreme Court has used the right to life as a basis for emphasizing the need to take drastic steps to combat air and water pollution. [23] It has directed the closure or relocation of industries and ordered that evacuated land be used for the needs of the community. [24] The courts have taken a serious view of unscientific and uncontrolled quarrying and mining, [25] issued orders for the maintenance of ecology around coastal areas, [26] shifting of hazardous and heavy industries [27] and in restraining tanneries from discharging effluents. [28]

Another expansion of the right to life is the right to livelihood (article 41), which is a directive principle of state policy. This extension can check government actions in relation to an environmental impact that has threatened to dislocate the poor and disrupt their lifestyles. A strong connection between the right to livelihood and the right to life in the context of environmental rights has thus been established over the years. Especially in the context of the rights of indigenous people being evicted by development projects, the Court has been guided by the positive obligations contained in article 48A and 51A(g), and has ordered adequate compensation and rehabilitation of the evictees.

Matters involving the degradation of the environment have often come to the Court in the form of petitions filed in the public interest. This mode of litigation has gained momentum due to the lenient view adopted by the Court towards concepts such as *locus standi* and the 'proof of injury' approach of common law. This has facilitated espousal of the claims of those

who would have otherwise gone unrepresented. It is interesting to note that, unlike Indian courts,_the Bangladeshi and Pakistani courts apply an 'aggrieved person' test,_which means a right or recognised interest that is direct and personal to the complainant.

Sustainable Development- The Way Out

Awareness of the major challenges emerging both as regards development and with reference to the environment has made possible a consensus on the concept of "sustainable and environmentally sound development" which the "Earth Summit", meeting in Rio in 1992, endeavoured to focus by defining an ambitious programme of action, Agenda 21, clarified by a Declaration of 27 principles solemnly adopted on that occasion. We can also refer to the content of the Declaration on International Economic Cooperation adopted by the General Assembly in May 1990, which clearly recognizes that "Economic development must be environmentally sound and sustainable."

The concept of sustainable development contains three basic components or principles. First among these is the precautionary principle, whereby the state must anticipate, prevent and attack the cause environmental degradation.^[29] The Declaration affirms the principle by stating that where ever "there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a reason for postponing costeffective measures to prevent environmental degradation."[30] Most of the cases of the 1990's deal with the definition of the principle. In 1996, the Supreme Court[31] stated that environmental measures, adopted by the State Government and the statutory authorities, must anticipate, prevent and attack the causes of environmental degradation. Following the definition provided in the Rio Declaration, the Court stated that where there are threats of serious and irreversible damage, lack of scientific certainty should not be used as a reason for postponing measures to prevent environmental degradation. The Supreme Court has accepted the principle and applied it on several occasions. In the *Taj Trapezium Case*, applying the precautionary approach the Supreme Court ordered a number of industries in the area surrounding the Taj Mahal to relocate or introduce pollution abatement measures in order to protect the Taj from deterioration and damage.

An interesting comment on the precautionary principle by the Supreme Court of Pakistan is worthy of mention here. The Court in *Shehla Zia v. WAPDA[31]* commented: "The precautionary policy is to first consider the welfare and the safety of the human beings and the environment and then to pick up a policy and execute the plan which is more suited to obviate the possible dangers or make such alternate precautionary measures which may ensure safety. To stick to a particular plan on the basis of old studies or inconclusive research cannot be said to be a policy of prudence or precaution."

The second component of the doctrine of sustainable development is the principle of 'polluter pays'. The principle states that the polluter not only has an obligation to make good the loss but shall bear the cost of rehabilitating the environment to its original state.^[32] In operation, this principle is usually visible alongside the precautionary principle.

A Native American proverb states that "we do not inherit the planet from our ancestors but borrow it from our children", this is the next significant component of sustainable development - the principle of intergenerational equity. The Brundtland Commission defined sustainable development as development 'which meets the needs of the present without compromising the ability of the future generations to meet their own needs.' The principle envisages that each generation should be required to conserve the diversity of the natural and cultural resource base, so that it does not unduly restrict the options available to future generations in solving their problems and satisfying their own values, and should also be entitled to diversity comparable to that enjoyed by previous generations. This principle is called "conservation of options." Secondly, each generation should be required to maintain the quality

of the planet so that it is passed on in no worse condition than that in which it was received, and should also be entitled to planetary quality comparable to that enjoyed by previous generations. This is the principle of "conservation of quality." *Thirdly*, each generation should provide its members with equitable rights of access to the legacy of past generations and should conserve this access for future generations. This is the principle of "conservation of access." [32]

Another important aspect of the right to life is the application of public trust doctrine to protect and preserve public land. This doctrine serves two purposes: it mandates affirmative state action for effective management of resources and empowers the citizens to question ineffective management of natural resources. Public trust is being increasingly related to sustainable development, precautionary principle and bio-diversity protection. Moreover, not only can it be used to protect the public from poor application of planning law or environmental impact assessment, it also has an intergenerational dimension. When the Supreme Court has applied the public trust doctrine, it has considered it not only as an international law concept, but also as one which is well established in our domestic legal system. Its successful application in India shows that this doctrine can be used to remove difficulties in resolving tribal land disputes and cases concerning development projects planned by the government. In M.C. Mehta v. Kamal Nath and Others,[33] the court added that '[it] would be equally appropriate in controversies involving air pollution, the dissemination of pesticides, the location of rights of ways for utilities, and strip mining of wetland filling on private lands in a state where governmental permits are required.' In both M.I. Builders Pvt. Ltd[34] and Th. Majra Singh,[35] the court reconfirmed that the public trust doctrine 'has grown from article 21 of the constitution and has become part of the Indian legal thought process for quite а long time.'Expanding democratic and individual participation

A development strategy which does not take into account the human, social and cultural dimension could have only adverse repercussions on the environment. A national development strategy is viable from the economic, social and ecological standpoint only if it gains the active adherence of the various social strata of the population. The United Nations Conference on Environment and Development was of the view that that one of the fundamental prerequisites for the achievement of sustainable development was broad public participation in decision-making. Furthermore, the Conference recognized, in the specific context of environment, "the need for new forms of participation" and "the need of individuals, groups and organizations to participate in environmental impact assessment procedures and to know about and participate in (pertinent) decisions."[36] The Conference implicitly linked the notion of real participation in the right of access to information by noting that "Individuals, groups and organizations should have access to information relevant to environment and development held by national authorities, including information on products and activities that have or are likely to have a significant impact on the environment, and information on environmental protection measures". The link between participation and information can also be found in Principle 10 of the Declaration of Rio.

Conclusions

The advancement of the relationship between human rights and the environment would enable the incorporation of human rights principles within an environmental scope, such as anti-discrimination standards, the need for social participation and the protection of vulnerable groups. At the same time, the human rights system would be strengthened by the incorporation of environmental concerns, enabling the expansion of the scope of human rights protection and generation of concrete solutions for cases of abuses. Of course, one of the most important consequences is to provide victims of environmental degradation the possibility to access

to justice. Given the occasional helplessness suffered by victims of environmental degradation, linking human rights and the environment brings such victims closer to the mechanisms of protection that are provided for by human rights law.

It is apparent that environmental and human rights are inextricably linked. As we increasingly recognize the serious impact of a degraded environment on human health and well being, we are better placed to adjust our policies and cultural practices to reflect our enhanced understanding. As a result, we should be able to protect human rights and human dignity within its broader social, economic and cultural context by drawing from and contributing to those who are actively engaged in the environmental and public health arenas. This should also facilitate those who are working in the environmental and conservation fields to develop a better working relationship with those in the human rights arena. This will eventually lead to the articulation of a more integrated approach to dealing with socio-economic and environmental problems, encouraging the development of a sustainable model for the preservation of biological resources and natural ecosystems, for the use and enjoyment of both present and future generations.

I would like to end with a thought by Elwyn Brooks White, in his book, 'Essay of E.B. White'.

"I would feel more optimistic about a bright future for man if he spent less time proving that he can outwit Nature and more time tasting her sweetness and respecting her seniority......
